

PMS Panel Mount Power Supply

PMS 750 W series / PMS-□V750W1BTD

PMS

Highlights & Features

- Universal AC input voltage
- Up to 750 Watt in 7" x 4" x 1.575" package
- Peak power supported
- Full power up to 50°C ambient
- Option for constant current
- Up to 500 Khrs MTBF
- 5 V / 2 A standby output
- Active current sharing
- Conformal coating
- Class B Conducted and Radiated EMI
- Remote On/Off and Power Good Signal
- PMBus Ver 1.3 supported
- Intelligent fan speed control
- Optional USB/RS232/RS485 adapter for communication
- Compliance to SEMI F47 @ 200Vac

Safety Standards

CB Certified for worldwide use

Model Number: PMS-□V750W1BTD
Unit Weight: 1.1 kg (2.4 lb)
Dimensions (L x W x H): 177.8 x 101.6 x 40 mm
 (7 x 4 x 1.575 inch)

General Description

PMS Series 750 W power supply offers the nominal output voltage of 24 V/48 V across a wide operating temperature range from -20°C to +70°C and obtains shock and vibration certification IEC 60068-2. The product is designed with 1U low profile and comes with a universal AC input voltage ranging from 85 Vac to 264 Vac. The PMS series is made for installation in limited spaces. Its built-in active PFC circuit provides high power factor values and conforms to harmonic current emission standards IEC/EN 61000-3-2, Class A.

Model Information

PMS Panel Mount Power Supply

Model Number	Input Voltage Range	Rated Output Voltage	Rated Output Current
PMS-24V750W1BTD	85 Vac ~ 264 Vac	24 Vdc	31.25 A
PMS-48V750W1BTD		48 Vdc	15.63 A

Model Numbering

Specifications

Model Number	PMS-24V750W1BTD	PMS-48V750W1BTD
--------------	-----------------	-----------------

Input Ratings / Characteristics

Nominal Input Voltage	100-240 Vac
Input Voltage Range	85-264 Vac
Nominal Input Frequency	50-60 Hz
Input Frequency Range	47-63 Hz
Input Current (max)	9A
Input Surge Voltage (max)	300 Vac for 100 ms
Efficiency at 100% Load @ 230Vac	94% typ.
Max Inrush Current (Cold Start)	40 A @ 264 Vac, cold start
No Load Power Consumption	5 W typ. @ remote off status
Power Factor at 100% Load	0.95 @ 115 V/50 Hz, 230 V/50 Hz
Leakage Current	< 0.3 mA @ 240Vac

Output Ratings / Characteristics*1

Nominal Output Voltage	24 Vdc	48 Vdc
Total Regulation	± 3%	± 3%
Output Voltage Adjustment Range (CV mode)	24-28 Vdc	48-56 Vdc
Output Current (CV mode)	0-31.25 A	0-15.63 A
Current Trimming Range (CC mode)	11 A ~ 28.4 A (voltage range 21.1V~26.9V, and P<750W)	8.7 A ~ 17.4 A (voltage range 42.2V~53.8V, and P<750W)
Output Power (max)	750 W	
Peak Power (max)	24 V: 900 W peak for 3 sec, @ 180~264 Vac 48 V: 1,200 W peak for 3 sec, @ 180~264 Vac	
Line Regulation	±0.5%	
Load Regulation	±1%	
PARD*2 (20MHz)	<1% Vrated pk-pk	
Rise Time	<50 ms	
Start-up Time	2,000 ms with AC turn on	
Hold-up Time	12 ms typ. @ 100% load, with nominal input range	
Dynamic Response (Overshoot & Undershoot O/P Voltage)	± 5% @ 115 & 230 Vac input with 0-50% or 50-100% load change ± 10% @ 115 & 230 Vac input with 5-100% load change	
Start-up with Capacitive Loads	6,000 uF	
Nominal Standby Voltage Output*3	5 V	
Nominal Standby Current Output	2 A	
Total Regulation of Standby Output	± 3%	
Ripple & Noise of Standby Output	100 mV max	
Remote Sense	Up to 500 mV compensation for voltage drop across external wire connections to load. Short and reverse connection protected.	

*1 For power de-rating from > 50°C to 70°C, see power de-rating on page 8.

*2 PARD is measured with an AC coupling mode, and in parallel to end terminal with 0.1μF ceramic capacitor & 47μF electrolytic capacitor. PSU need to burn in > 5 minutes when AMB ≤ 0°C

*3 5V standby output is always on when AC is present

Dimensions

L x W x H: 177.8 x 101.6 x 40 mm (7 x 4 x 1.575 inch)

Notes:

1. Base plate mounting, M4 thread holes, maximum penetration 3.0 mm (0.12 inch) from outside face of chassis, torque 9~10 kgf.cm (7.8~8.7 inch.lbs).
2. Side mounting, M4 thread holes, maximum penetration 3.0 mm (0.12 inch) from outside face of chassis, torque 9~10 kgf.cm (7.8~8.7 inch.lbs).
3. CN101/CN102, M4 screw in two positions, torque 9~10 kgf.cm (7.8~8.7 inch.lbs).
4. VR: clockwise is to increase the output voltage, anti-clockwise is to reduce the output voltage.
5. Built-in cooling fan. Must prevent dust suction into power supply, or use natural convection power supply if any concerns.
6. All dimensions are in millimeters and inches.

Engineering Data

Output Load De-rating VS Surrounding Air Temperature

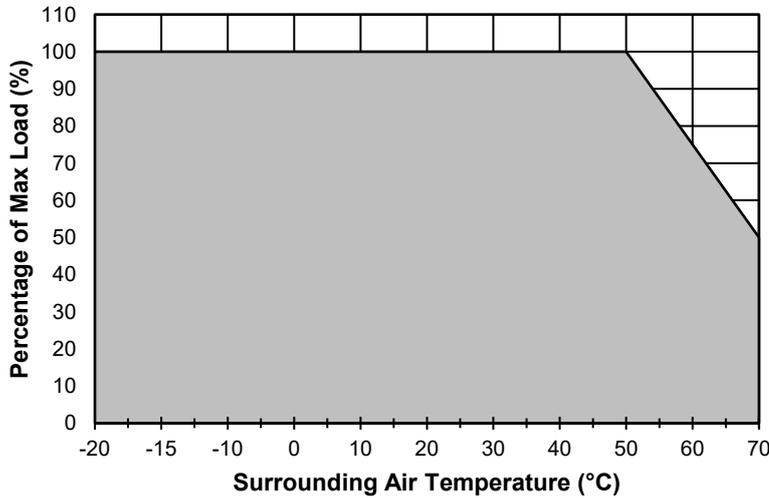

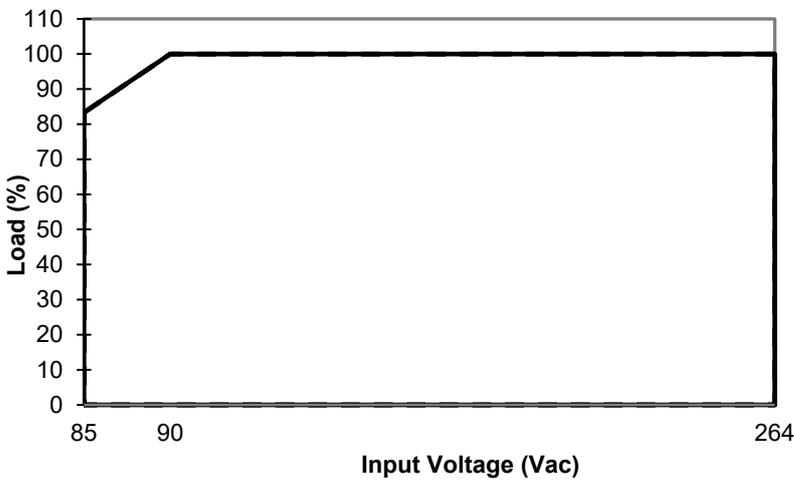

Fig. 2 De-rating for Horizontal Mounting Orientation
 > 50°C de-rate power by 2.5% / °C

Note

1. Power supply components may degrade, or be damaged, when the power supply is continuously used outside the shaded region, refer to the graph shown in Fig. 2 & Fig. 3.
2. The PSU will be bouncing and start up time will not exceed 5s when ambient temperature at -20°C.
3. If the output capacity is not reduced when the surrounding air temperature >50°C, the device will run into Over Temperature Protection. When activated, power supply will latch off, until the surrounding air temperature is lowered or the load is reduced as far as necessary to keep the device in working condition, and require removal/re-application of input AC voltage in order to restart.
4. In order for the device to function in the manner intended, it is also necessary to keep a safety distance as recommended in the safety instructions while the device is in operation.
5. Depending on the surrounding air temperature and output load delivered by the power supply, the device can be very hot!

Output Load De-rating VS Input Voltage

- No output power de-rating for the input voltage from 90 Vac to 264 Vac

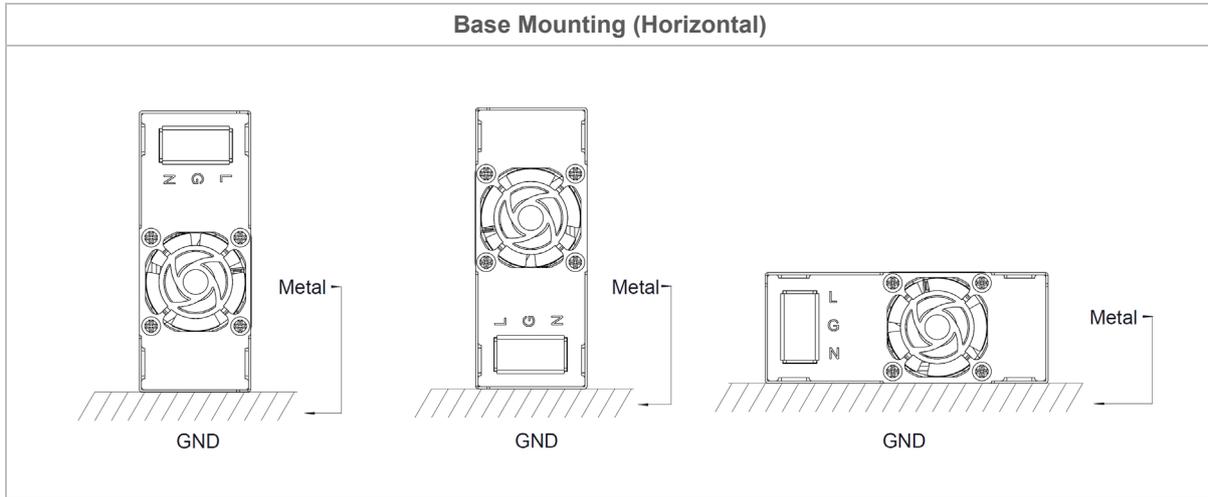

Fig. 3 De-rating for AC Input Voltage
 < 90 Vac de-rate power by 3.33% / V (100% load @ 90 Vac)

PMS Panel Mount Power Supply

PMS 750 W series / PMS-□V750W1BTD

Assembly & Installation

- Ⓐ Base Mounting: Fig. 4 shows the mounting hole locations for power supply assembly onto a metal mounting surface.
- Ⓑ This surface belongs to customer's end system or panel where the power supply is mounted.
- Ⓒ Connector

* If the device has to be mounted in any other orientation, please leave a message via the [Contact Us](#) form.

Installation of Mounting Accessories

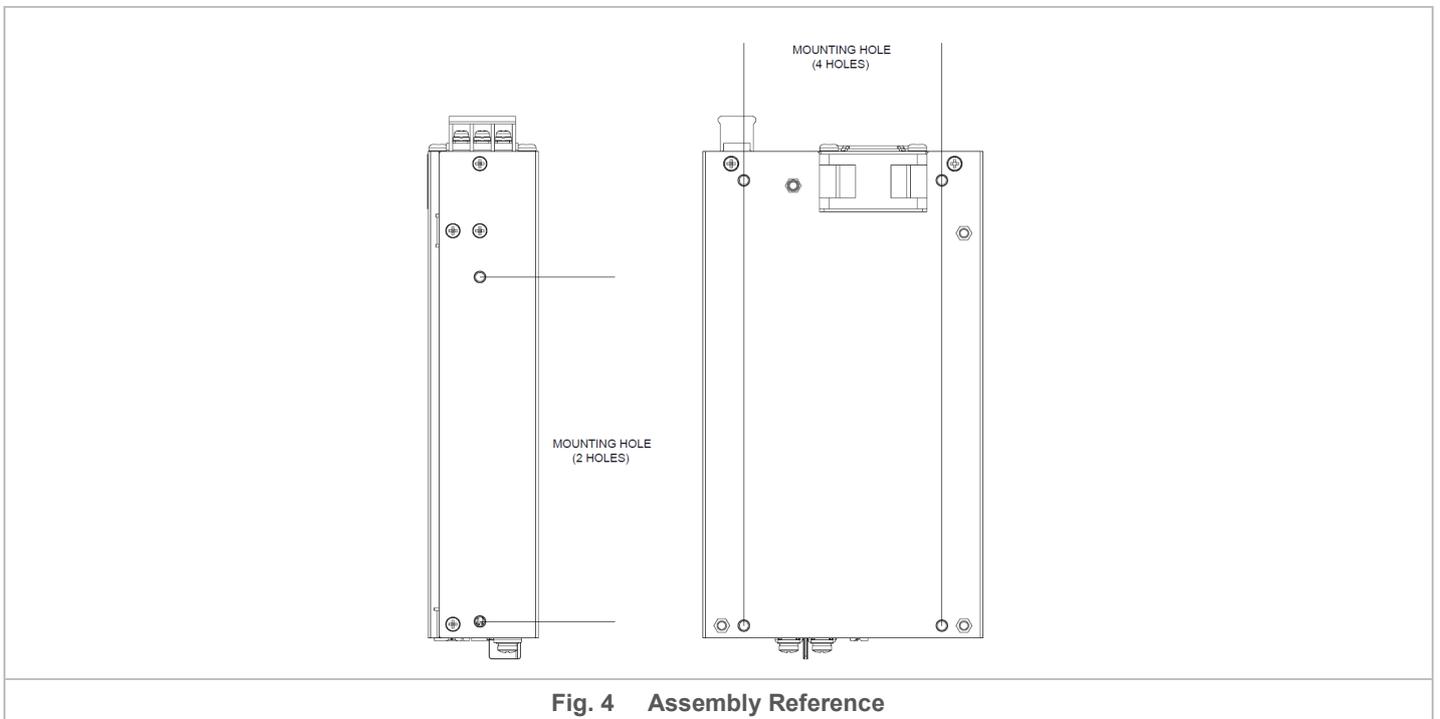

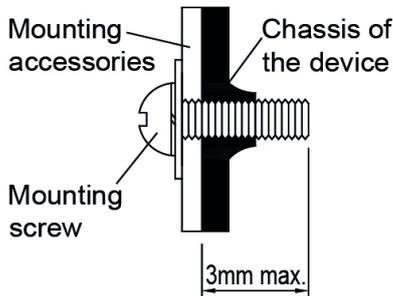

Fig. 4 Assembly Reference

PMS Panel Mount Power Supply

PMS 750 W series / PMS-□V750W1BTD

- Only use M4 screw ≤ 3 mm (0.12 inch) through the base mounting holes. This is to keep a safe distance between the screw and internal components.
- Recommended mounting tightening torque: 7~10 Kgf.cm (7.8~8.7 inch.lbs).

Fig. 5 Mounting Screw

Safety Instructions

- If user's mounting orientation is not according to the recommended mounting orientations, please consult Delta for further information.
- To ensure sufficient convection cooling, always maintain a safety distance of ≥ 50 mm (1.97 inch) from all ventilated surfaces while the device is in operation.
- The device is not recommended to be placed on low thermal conductive surface. For example, plastics.
- The enclosure of the device can become very hot depending on the ambient temperature and load of the power supply. Do not touch the device while it is in operation or immediately after power is turned OFF. Risk of burning!
- Do not touch the terminals while power is being supplied. Risk of electric shock.
- Prevent any foreign metal, particles or conductors from entering the device through the openings during installation. It may cause: Electric shock; Safety Hazard; Fire; Product failure
- The power supply must be mounted by metal screws onto a grounded metal surface. It is highly recommended that the Earth terminal on the connector be connected to the grounded surface.

PMS Panel Mount Power Supply

PMS 750 W series / PMS-□V750W1BTD

Functions

Start-up Time

The time required for the output voltage to reach 90% of its final steady state value, after the input voltage is applied.

Rise Time

The time required for the output voltage to change from 10% to 90% of its final steady state value.

Hold-up Time

Time between the collapse of the AC input voltage, and the output falling to 90% of its steady state value.

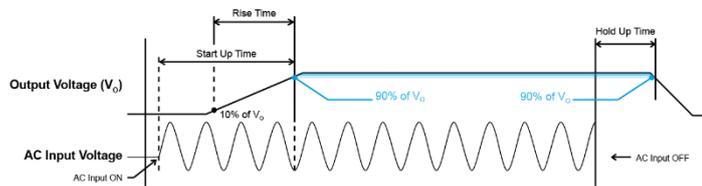

Fig. 6 Time Sequence

Dynamic Response (Main Output)

The power supply output voltage will remain within $\pm 5\%$ of its steady state value, when subjected to a dynamic load 50 to 100% of its rated current.

■ 50 to 100% Load

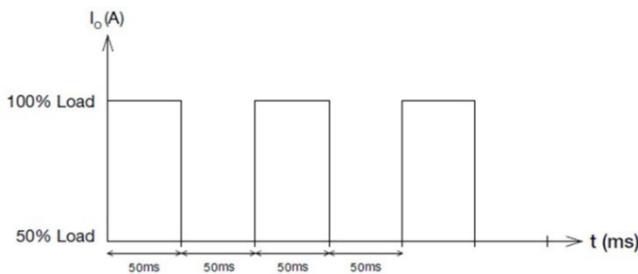

Fig. 7 Dynamic Load

Inrush Current

Inrush current is the input current that occurs when the input voltage is first applied. For AC input voltages, the maximum peak value of inrush current will occur during the first half cycle of the applied AC voltage. This peak value decreases exponentially during subsequent cycles of AC voltage.

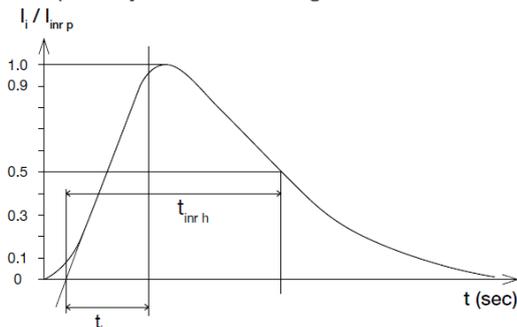

Fig. 8 Inrush Current

Short Circuit Protection

Output OLP/OCP function also provides protection against short circuits. When a short circuit is applied, the output current will operate in “Hiccup mode”. The power supply will return to normal operation after the short circuit is removed.

Overvoltage Protection

The power supply’s overvoltage circuit will be activated when its internal feedback circuit fails. The output voltage shall not exceed its specifications defined on Page 6 under “Protections”. Power supply will latch off, and require removal/re-application of input AC voltage in order to restart.

Overload & Over current Protections

The power supply’s main output overload (OLP) and over current (OCP) Protections is achieved by constant output current control. If the output current increases higher than rated current, the current will be clamped to be constant ($<130\%$ rated current) output voltage will then drop if output impedance keeps decreasing in the constant current control. Finally output under voltage protection will be triggered if the output voltage falls below 85% rated value and enters “Hiccup mode” (Auto-Recovery). The power supply will recover once the fault condition causing the OLP and OCP is removed and I_o is back within the specified limit.

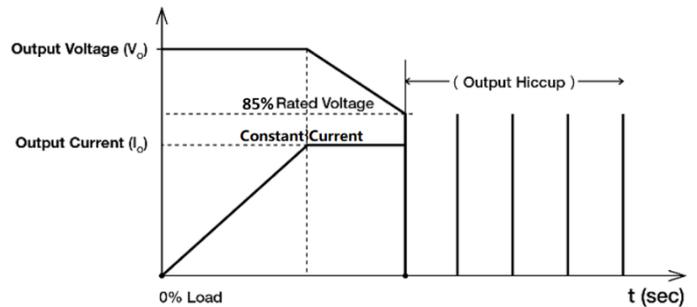

Fig. 9.1 Hiccup at OLP/OCP (For 24 V)

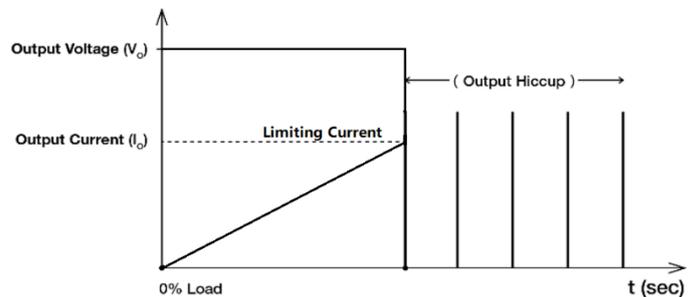

Fig. 9.2 Hiccup at OLP/OCP/OPP (For 48 V)

Additionally, if the output current is $>100\%$ or total power is $>100\%$ for a prolong period of time (depending on the load), the Over Temperature Protection (OTP) may be activated due to high temperature on critical components. The power supply will then go into latch mode (OTP).

PMS Panel Mount Power Supply

PMS 750 W series / PMS-□V750W1BTD

Over Temperature Protection

As mentioned above, the power supply also has Over Temperature Protection (OTP). This is activated when the overload condition persists for an extended duration and the output current is below the overload trigger point but >100% load. In the event of a higher operating temperature condition at 100% load, the power supply will run into OTP when the surrounding air temperature is higher than the operating temperature. When activated, the output voltage will go into latch mode until the input voltage is removed; then, reapplied, and the surrounding air temperature drops to its normal operating temperature.

Power Good

Power Good+/- pin is an isolated open collector transistor (80V/50mA rating). A resistor (suggested value 10 Kohm, 1/8 W) can be added between Power Good- pin and DC RTN, Power Good+ pin can be connected to 5 V standby (or, other available pull-up voltage that is no greater than the transistor rating). Value of resistor may have to be adjusted, depending on voltage used, and other end-use conditions of the Power Good+ pin connection to the product. When AC input is on, Power Good Signal (Shown in below figure) generated will be high. When AC input is off, Power Good Signal generated will be low. There will be a minimum of 5 milliseconds (at 750W load) between the time the Power Good Signal goes to low level, and the time when the output reaches 90% of its rated value.

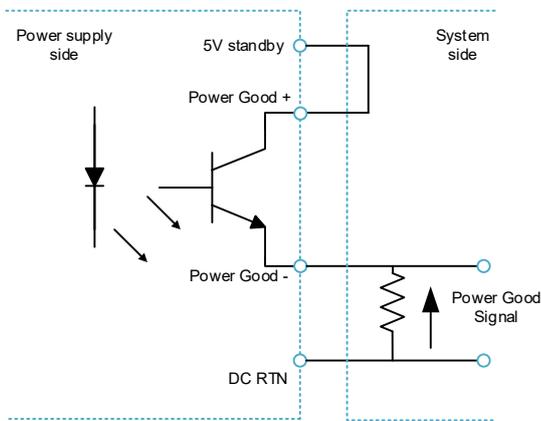

Fig. 10 Power Good Connection

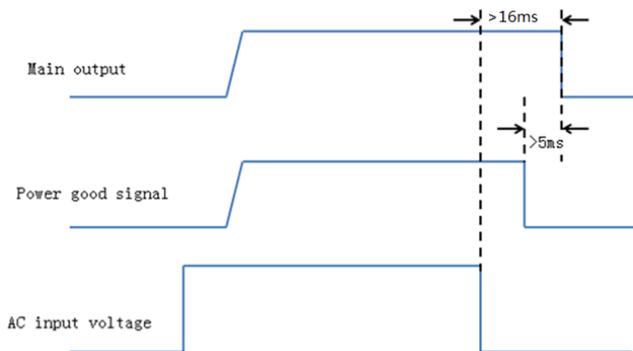

Fig. 11 Power Good Time Sequence

Remote On_Off/Inhibit

Remote ON_OFF/INHIBIT uses an isolated diode located within the power supply. This signal can be used to enable or disable only the main output. When the main output is disabled, the +5 V Standby output will continue to operate. System can use a switch to conduct through this diode (suggested pull up resistor to 5 V standby with 1 Kohm resistor) to disable the main out.

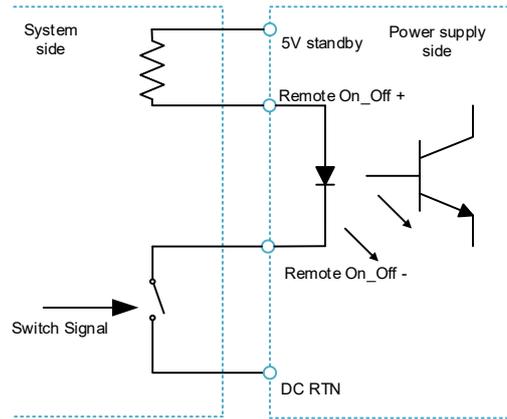

Fig. 12 Remote On_Off Connection

Remote Sense

Remote sense feature can be used to compensate for the extra voltage drop on output wires that are connected from the main output terminals, to the load. With wires connected from the remote sense pins, at the same locations as the wires from the main output, the remote sense function can compensate up to 500mV voltage drop. The power supply will not be damaged if the remote sense pins are shorted, or if a reverse/inverted polarity connection is made to the load

Voltage Adjustment

The power supply provides a potentiometer for user to adjust the output voltage. The output voltage is designed to be able to adjust up to ± 10% of rated voltage, when the output is adjusted below nominal value, the maximum output current is the same as the nominal output, when the output is adjusted above nominal value, the output power cannot exceed the nominal maximum power (the maximum output current will be reduced accordingly).

PMBus

The power supply can communicate with the host product, using PMBus version 1.3 protocols. Multiple functions can be realized, such as monitoring the power supply operation status, and editing the power supply operating set-points. See user instruction for detailed control information.

PMS Panel Mount Power Supply

PMS 750 W series / PMS-□V750W1BTD

Current Sharing

The power supply supports parallel current sharing function. Two power supply main outputs are connected in parallel and connected to the Current Share port can enable this function (Pin13 of CN603, refer to the power structure diagram and lead Foot definition), up to six power supplies can be connected in parallel.

When the power supply is connected in parallel, adjust the voltage difference between different power supplies to within ± 150 mV, and ensure that the maximum output current does not exceed 80% of the rated current.

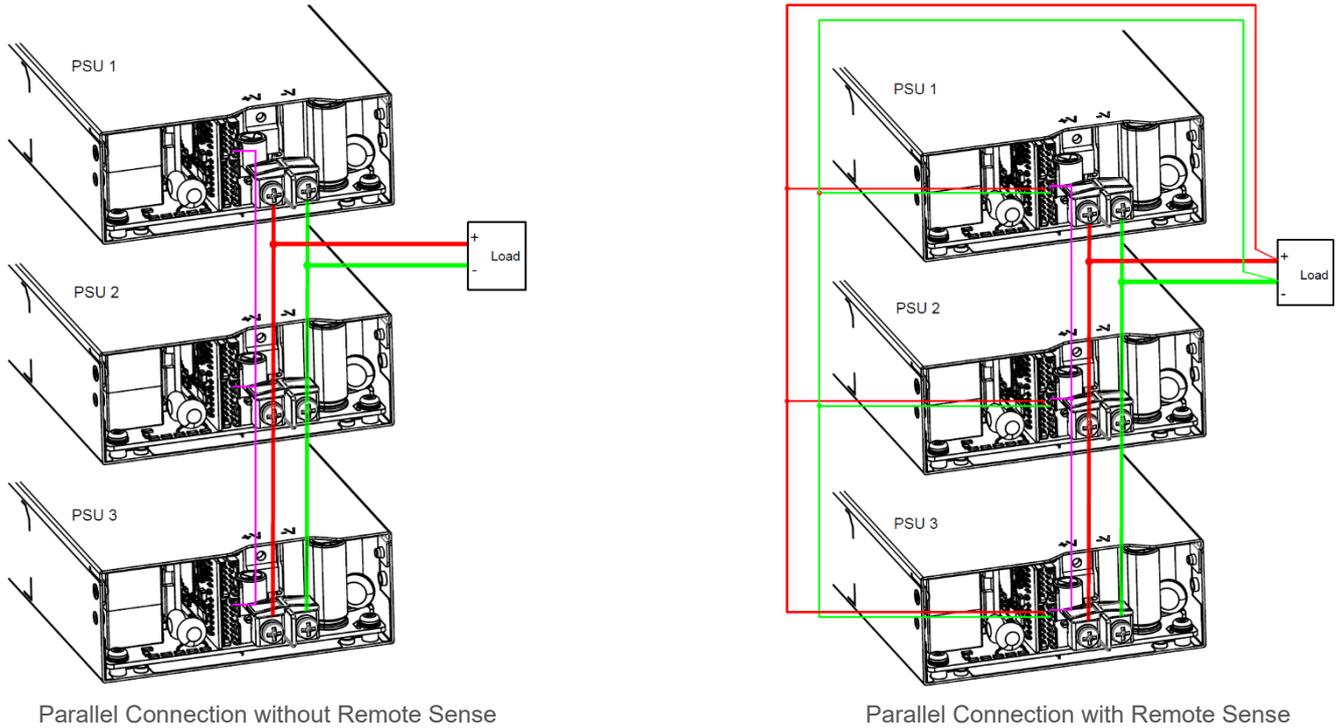

Fig. 13 Parallel Connection

PMS Panel Mount Power Supply

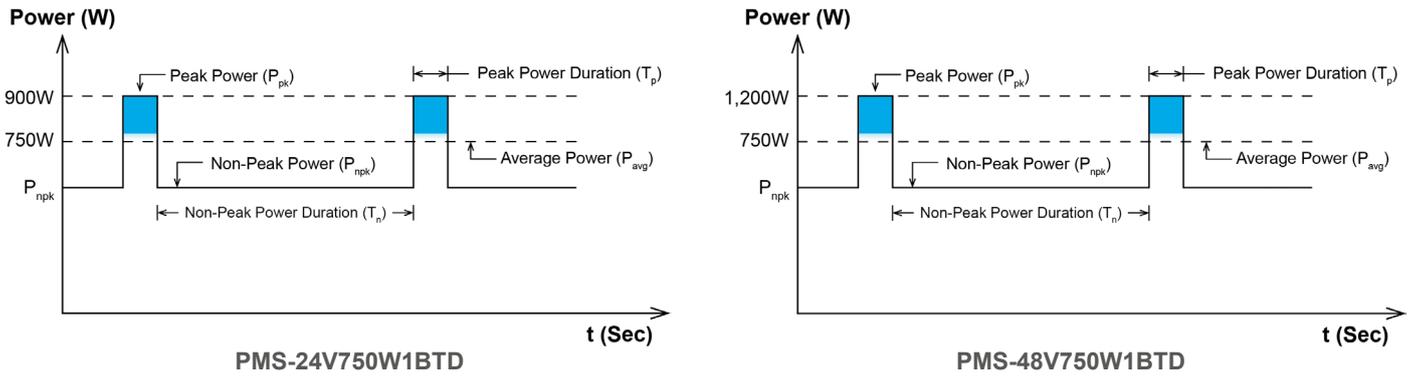

PMS 750 W series / PMS-□V750W1BTD

Peak Power

Peak Power (P_{pk}) is the reserve power available constantly that allows reliable startup to support sudden and short spike of loads with high inrush current typically during turn on to remove the need of more expensive higher rated power supply unit.

After the output has reached its steady state set value, the power supply can support surge loads with a higher short-term power demand up to P_{pk} , for a maximum duration of 3 seconds.

During peak power, limit the average power within 8 seconds to no more than the rated output power (P_{rated}).

$$Duty\ cycle\ (\%) = \frac{T_p}{Total\ Time} ; (T_p \leq 3\ sec)$$

$$Average\ Output\ Power\ (P_{avg}) = \frac{(P_{pk} \times T_p) + (P_{npk} \times T_n)}{Total\ Time}$$

OR

$$Non-Peak\ Power\ (P_{npk}) = \frac{(P_{avg} \times Total\ Time) - (P_{pk} \times T_p)}{T_n}$$

Peak Power (%)	Voltage	Peak Power (P_{pk})	Peak Power Duration (T_p)	Duty Cycle	Non-Peak Power (P_{npk})	Non-Peak Power Duration (T_n)	Total Time (T)
120%	24V	900W	3 sec	37.5%	660W	5 sec	8 sec
160%	48V	1,200W			480W
